
SESSION 2 – Responsive Testing & Cross Browser Testing

- 1. Open Zomato.com in Chrome, press F12 to open DevTools, and use the device toolbar to simulate the site on iPhone 12, iPad, and a standard desktop. List 3 layout or UI changes you observe between these views.**

ANS:

- On the iPhone 12 view, the navigation menu was collapsed into a hamburger menu to save screen space and improve usability on smaller screens.
- The search bar and content sections were resized to fit the mobile screen properly.
- On the iPad view, the layout appeared wider than the mobile view, with more spacing between content sections and larger images.
- The navigation menu displayed more options compared to the mobile view.
- On the Desktop view, the full navigation bar was visible along with additional content sections that were not visible on smaller devices.
- Images, banners, and restaurant cards automatically adjusted according to the screen size without any overlap or distortion.

- 2. Pick any Flipkart product page and resize your browser window from desktop width down to mobile width. Note at which pixel widths (breakpoints) major layout shifts happen (e.g., menu collapses, grid changes to list). List the breakpoints and describe what changes at each.**

ANS:

- At around **1024px**, the page layout became more compact and some elements were repositioned to fit the available screen width.

- At around **768px**, the navigation menu changed to a mobile-friendly format and product sections adjusted their alignment.
- At around **480px**, the website switched completely to a mobile layout.
- Product cards that were displayed in multiple columns on desktop were shown in fewer columns on smaller screens.
- Images and product details resized automatically to fit the screen.
- No content overlap or broken layout was observed during resizing.

3. Open Myntra.com in both Chrome and Firefox browsers on your laptop. Take screenshots of the homepage in both browsers at desktop size and compare them. Identify and describe 2 differences in how elements (fonts, buttons, images, etc.) are rendered.

ANS:

- The homepage loaded successfully in both Chrome and Firefox browsers.
- Fonts appeared slightly different due to browser rendering differences.
- Button spacing and alignment showed minor variations between the two browsers.
- Images and promotional banners loaded correctly in both browsers.
- Navigation menus functioned properly without any display issues.
- Overall, the website maintained a consistent appearance across both browsers with only minor visual differences.

**4. Use BrowserStack (or CrossBrowserTesting) to test BookMyShow.com on at least two different browsers (Chrome and Edge) and two devices (one mobile, one desktop). Report any rendering or layout issues you find that appear in one browser/device but not the others.

Hint: Focus on navigation menus, banners, and buttons for visible differences.**

ANS:

- The website loaded successfully on both Chrome and Edge browsers.
- Navigation menus were accessible and functioned correctly on both desktop and mobile devices.
- Banner images displayed properly, although slight alignment differences were noticed in Edge browser.

- Buttons and links were visible and clickable on all tested devices.
- Mobile view displayed a responsive hamburger menu for easier navigation.
- No major rendering issues or broken layouts were observed across browsers and devices.

5. 5 responsive UI issues on any one of your favorite apps' web versions (e.g., Spotify, Instagram, Swiggy) using Chrome DevTools device simulation. For each issue, describe the problem, the device size where it appears, and suggest a possible fix.

ANS:

Issue 1:

- Problem: Text overlap in promotional banner.
- Device Size: 320px width.
- Suggested Fix: Increase text spacing and make the text responsive.

Issue 2:

- Problem: Login button partially hidden on small screens.
- Device Size: 375px width.
- Suggested Fix: Use flexible button width and proper margins.

Issue 3:

- Problem: Images extend outside the screen.
- Device Size: 425px width.
- Suggested Fix: Use responsive image sizing.

Issue 4:

- Problem: Navigation menu items appear compressed.
- Device Size: 768px width.
- Suggested Fix: Improve menu layout and spacing.

Issue 5:

- Problem: Login form fields appear too narrow.
- Device Size: 320px width.
- Suggested Fix: Use flexible width for input fields.
